

Incident Response Plan

Document ID	ATL-PLN-002
Version	0.9 (draft)
Owner	Chief Technology Officer
Status	Draft, not yet exercised

1. Incident response team

The CTO acts as incident lead. The support manager and one senior engineer form the incident response team.

2. Severity levels

Incidents are classified into three severity levels: low, high and critical, based on data affected and service impact.

3. Escalation

The escalation path and contact list for the team, AWS support and legal counsel are kept in the shared drive.

4. Response steps

Containment: isolate affected systems and revoke compromised credentials.

Eradication and recovery: remove the cause, restore services and monitor for recurrence.

The incident lead decides whether to notify affected customers.

5. After the incident

A lessons learned meeting is held for every high or critical incident.
